

I support the original RM-11306 from the ARRL League and not their March revision.

I support allowing the amateur community to develop a voluntary band plan that will meet the needs of all amateurs (except the few whiners).

Winlink 2000 has great potential for use during emergencies. Other digital modes can and will make great changes in the amateur activity. We need the ability to make those changes and find ways to use our frequencies to meet all our needs.

Winlink 2000 falls under 97.221 C (1), and 97.221 c (2) limits any and all modern higher speed protocols. It also severely limits any action under an emergency since the frequencies used will be predetermined and known.

Voluntary band planning within defined limits has proven successful in the Amateur Service. There is no reason why it should not be allowed to continue.
